Research Interests

My research develops **AI foundation models for protein structure, interaction, and dynamics**, combining geometric deep learning, physics-grounded priors, and large-scale molecular dynamics data. I am particularly interested in (i) **physically valid biomolecular generation**, (ii) **scalable protein–protein interaction discovery**, and (iii) **Transformer-based neural simulators that learn protein conformational dynamics from MD trajectories**.

Education

University of British Columbia

Sep 2025 - Present

Ph.D. in Computer Science

Advisor: Prof. Peter Yichen Chen

Shanghai Jiao Tong University

Sep 2021 - Jun 2025

B.S. in Physics, Minor in Computer Science and Technology

GPA: 3.89 / 4.30 (Ranking 1 / 30; Average 90.31 / 100)

Exchange Student, University of Toronto (Sep - Dec 2024)

Research Experience

AI for Protein Structure, Interaction, and Dynamics

Jan 2025 - Present

- **Gauss–Seidel Projection for Biomolecular Complexes** (published at ICLR 2026): a differentiable projection that enforces physical validity (non-penetration, geometric consistency) on protein structure prediction foundation models, eliminating steric clashes in predicted biomolecular complexes while improving inference efficiency.
- **Protein-TetSphere: Registered Volumetric Geometry for Protein Representation Learning** (Oct 2025 - Present; preprint, arXiv:2609.36277): a representation-alignment pretraining framework that treats tetrahedral-sphere (TetSphere) protein-surface meshes as a third modality alongside sequence and atomistic structure, using surface geometry as a bridge to align sequence and structural embeddings for fast, scalable PPI discovery.
- **WorldParticle for Protein Dynamics Modeling** (SIGGRAPH Asia 2026): a unified Transformer-based simulator that treats proteins as Lagrangian particle systems and learns their dynamics directly from large-scale **molecular dynamics (MD) trajectory data**, enabling fast, generalizable neural surrogates for protein conformational dynamics across heterogeneous biomolecular systems.

Neural Surrogate Models for Physical Dynamics

2024 - Jan 2026

- **Factorized Neural-Implicit DMD for Parametric Dynamics** (preprint, 2026): a physics-coded neural-field operator that learns a Koopman / DMD spectral decomposition of parametric dynamical systems, factorizing spatial modes from temporal dynamics to enable interpretable, stable long-horizon prediction and zero-shot parameter generalization – methodology directly transferable to biomolecular and continuum dynamics.

- **Temporally-Aware Subspace Fluid Simulation** (published at SIGGRAPH 2025): a learned reduced-order surrogate for high-dimensional PDE dynamics; an online temporally-adaptive subspace captures emergent low-rank structure across time, yielding orders-of-magnitude speedups over full-order solvers while preserving long-horizon physical fidelity.
